

VK Platform — overview for cable & ISP operators

Billing, CRM, and provider automation for Indian LCOs running Hathway, Railtel, IPTV (ANT), and OTT (SmartPlay) from one office.

Who it's for

- Multi-provider shops (cable + broadband + IPTV + OTT on the same customer)
- Teams with office staff and field collectors
- Operators who want renewals and status checks on dealer portals without logging in manually for every box

Customer & connection management

- Single customer record — name, phones, area/locality, address, GPS pin, notes, customer code
- Multiple connections per household — Railtel login, Hathway STB/VC, IPTV, OTT, each with plan, expiry, status
- Search & filters — by name, phone, STB/Railtel ID, area, provider, due/expiring/expired, follow-up, terminated STB
- Hybrid households — Hathway + Railtel on one account; renew and collect at customer level
- Custom / bundled pricing — household custom plan or per-connection overrides (incl. GST on plans)
- Account statement — running balance view (bills up, payments down) plus precise bill-payment allocation for renewals

Billing & collections

- Bills — period charges, opening balance, adjustments; link to connections where needed
- Collect payment — cash, UPI, cheque, etc.; default amount = full outstanding (partial pay supported; remainder stays on due)
- Optional "renew after collect" — queue provider renewal when payment is recorded (with staff approval before portal runs)
- Collect later / follow-up — renew on portal now, chase payment separately
- Bill checker — generate bills when paid periods end, with clear skip reasons (no silent failures)
- Receipts & bill print — payment receipts and bill documents from the UI
- Payment follow-up lists — who renewed but hasn't paid; quick collect from mobile lists

Provider portal automation (Railtel & Hathway)

- Job queue + single worker — one portal login at a time; no double-spend on dealer wallet
- Actions — renew, check status, batch status for expired follow-up lists, and related portal tasks
- Confirm before run — sensitive jobs wait for Confirm & run (collectors can be blocked from portal access)
- OTP step — when Railtel/Hathway asks for OTP, staff enter it on the job page; UI can auto-refresh while waiting
- Simulate vs live — rehearse full flow without touching portals; switch to live for production
- Scheduled sync — optional nightly/scheduled bulk status refresh from provider lists
- Provider dashboard — online/expired views, wallet-oriented workflows, sweep progress
- Railtel specifics — term plans (e.g. x3 / x6 / x10 months with correct validity), My Subscribers import, invoice PDF storage and optional WhatsApp send
- Hathway specifics — STB list, pack management path automation, VC/STB-centric customer views

IPTV (ANT) & OTT (SmartPlay)

- Dedicated IPTV / OTT sections — manage connections, plans, subscribe/renew flows tied to your partner portals

- Sync jobs — pull partner data where integrated (e.g. OTT sync)
- Same customer ledger model as cable/broadband where applicable

Mobile experience (collectors)

- Mobile v2 UI — card-based home, customer search, expiring/expired, unpaid renewals, pay QR
- Field agents — GPS ping on collect/visit, day sheet, collections tied to agent
- WhatsApp shortcuts — payment received, expiry reminders, complaint alerts (where enabled)
- Classic desktop UI — full tables for office; switch between layouts

Customer self-pay (shop QR)

- Public pay page — customer enters mobile or STB/Railtel ID, sees due, pays via UPI app or on-screen QR
- Staff confirmation — payment marked by customer → office confirms UPI → receipt + optional renewal job
- Settings — UPI VPA, payee name, enable/disable public portal
- Works with your own domain (e.g. HTTPS via Cloudflare Tunnel)

Complaints & operations

- Complaint log — create, assign agent, notes, mark fixed
- WhatsApp alerts — optional notify technicians group / agent / customer
- Activity log — audit trail of important actions

Plans, access & security

- Plans / packages — per provider, prices, GST; used for billing and renewals
- Multi-agent login — admin + collectors with granular permissions (view, collect, portal, packages, complaints, WhatsApp, settings)
- Provider scope — Railtel-only or Hathway-only agents if needed
- Area / locality — limit which customers a collector sees

Technical highlights (for IT-minded partners)

- SQLite database — single file backup
- Integer paise — no floating-point money bugs
- Background worker — renewals/status never block the web UI
- REST API — same operations as UI (for bots/scripts later)
- Optional demo instance — separate DB, simulate mode, training login (demo / demo123) on another port

Typical daily flow

- 1. Customer pays (field or office) → Collect payment (full or partial due).
- 2. Tick queue renewal → job waits for Confirm.
- 3. Worker renews on Railtel/Hathway → new bill period → payment applied → due updates.
- 4. Expiring/expired lists and optional scheduled status refresh keep the office list accurate.

What this is not (for this summary)

- Not a replacement for Hathway/Railtel dealer portals — it drives them safely from your data.
- Not tied to one billing back-office product; it's built for operators who run multiple upstream brands from one shop.
